The chosen software is by ABS Nautical Systems (ABS NS) and is called NS Enterprise.

The companies will work together to replace d'Amico's existing legacy software across its entire fleet. This transition to data-driven and reliability-based software will support faster, more accurate decision making for improved compliance and safety across all shipping operations.

NS Enterprise is an integrated digital platform that allows vessel owners and operators to increase the productivity of their operations and optimise performance. The fleet management system comprises software modules, mobile applications and enterprise asset management services.

“We look forward to partnering with d'Amico Group to support their digital journey,” said Evan Gooch, president of ABS Nautical Systems. “Our NS Enterprise software is designed around the needs of the mariner, and we are focused on helping clients with improved access and visibility to their data to meet critical operational and compliance challenges. We will work together to administer new technology and innovation that increases efficiency and reliability—an objective very important to d'Amico Group and their clients.”

“As a world leader in maritime transportation, we are constantly focused on the quality of ship management. Excellence and reliability are crucial in our business and for our top clients,” commented Cesare d'Api, deputy technical director of d'Amico Società di Navigazione.

“In line with our mission, we are constantly looking at the opportunities offered by the application of digital technologies and sharp analytics tools in maritime transportation. Such growing trends in digitalisation and mobile applications have clearly highlighted the need to move toward a change of tools for fleet management in order to exploit the value of data and information as

assets. A data dashboards driven business model is a smart and practical way to improve the effectiveness and efficiency of our maintenance processes. We are partnering with ABS NS because they have a unique combination of innovative software and maritime heritage. We look forward to deploying their software modules and mobile applications across our fleet of 70 vessels.”
